PRD v2 – CrossPay Future Scope (Bangladesh + Multi-market)

Prepared by Farha Jabin Oyshee

1. Product Overview

PRD v2 defines what CrossPay builds after the v0.1 mobile prototype: Bangladesh is the home market, two segments are served from day one, and the PRD v1 markets follow as a second wave.

Product Name: CrossPay

Product Type: Cross-border payment platform (mobile-first) — v2 adds family remittances, multi-market rollout and earnings-based services.

One-liner: CrossPay lets Bangladeshi freelancers and families receive money from abroad instantly and transparently, cash out to bKash, Nagad or a bank, and grow into a full financial home — then brings the same experience to Nigeria, the Philippines, India and LATAM.

What changed since v1

Area	PRD v1 (Aug 2025)	PRD v2 (this doc)
Home market	Nigeria + Philippines beta	Bangladesh first; NG, PH, IN, LATAM in phase 3
Segments	Freelancers and gig workers	Freelancer payouts + family remittances (per the 36-month model)
Pricing	Not defined	0.8% + $0.15 on incoming payments, 0.7% FX margin, free local payouts
Security	Device binding, biometrics	Adds SMS code + PIN, new-device selfie, step-up above $500, lockout and recovery (built in prototype)
Status	Scope locked for V1	Prototype v0.1 done; future scope proposed here

Problem Statement: Bangladeshi freelancers still lose days and hidden FX margin moving client payments home, and families receiving remittances often rely on informal channels that are fast but unprotected. CrossPay closes both gaps with one verified wallet and every fee shown upfront.

Target Users / Personas

- Digital freelancers in Bangladesh paid by clients abroad (Upwork, Fiverr, direct contracts)
- Families in Bangladesh receiving money from relatives working overseas

- Second wave: the PRD v1 personas in Nigeria, the Philippines, India and LATAM

2. User Research & Market Discovery

v2 research must validate Bangladesh-specific behaviour before phase 2 commits; v1's insights (trust, ease of use and payout speed matter most) still hold as the starting hypothesis.

User Insights to validate (BD)

- Freelancers want proof of foreign income for tax and bank purposes, not just a balance
- Families value speed and a known cash-out channel (bKash, Nagad) over app features
- Both segments distrust "zero fee" claims and react to a visible fee line
- Shared phones are common, so balance privacy and a quick app lock matter

Personas (v2)

1. **Rafi, 28, Dhaka — UI designer on Upwork**
    - Pain point: platform withdrawal takes days; FX margin is hard to see
    - Needs: payment links for direct clients, instant bKash cash-out, income statements
2. **Nasrin, 44, Sylhet — receives money from her husband in Riyadh**
    - Pain point: informal transfers are fast but leave no record and no protection
    - Needs: money landing in a wallet she already uses, in Bangla, with a clear arrival time
3. **Aisha (Lagos) and Carlos (Buenos Aires)** — the v1 personas, now the phase 3 targets

Competitive Analysis

Competitor	Strengths	Weaknesses
Payoneer	Widely used by BD freelancers; platform integrations	Withdrawal and FX costs users find hard to read
Wise	Transparent rates	Limited BD receive features; not wallet-first
Bank wire / SWIFT	Trusted, formal record	Slow, branch-dependent, intermediary fees
Informal channels	Fast, door-to-door	No consumer protection or record; illegal routes
CrossPay	Wallet-first, bKash/Nagad payout, fees upfront, Bangla, verified identity	New entrant; needs licensed partners

The competitor rows are working assumptions from the team, not a sourced study; validate them in the research sprint below.

Open research questions

- What share of BD freelancers already cash out to mobile wallets vs bank accounts?
- Which documents do banks and the tax office accept as proof of freelance income?

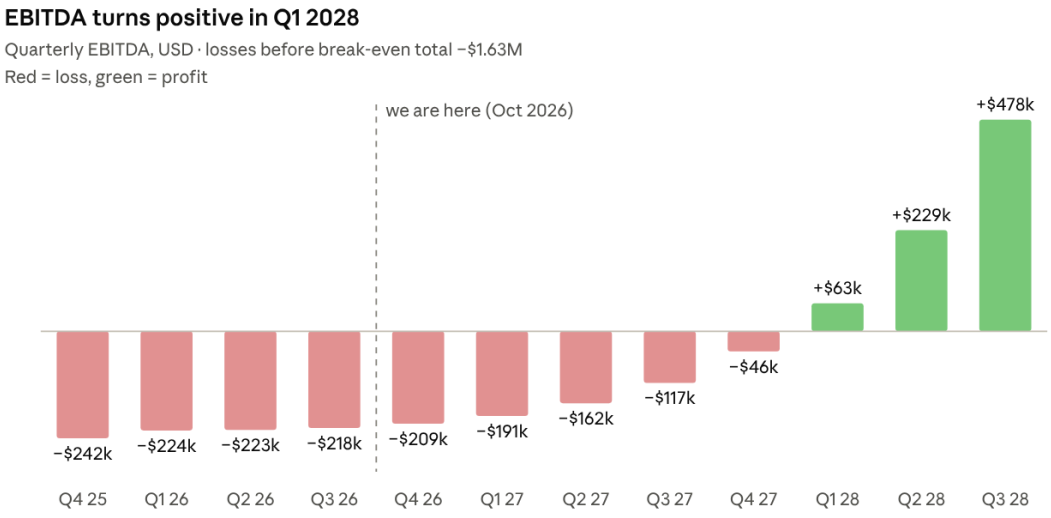

- Do remittance senders abroad (Gulf, UK, Malaysia) need their own CrossPay app, or a partner channel?
- How price-sensitive is each segment to the 0.7% FX margin vs speed?

3. Goals & KPIs

The financial model reaches 396,860 users and positive EBITDA in Jan 2028; v2's job is to hit those numbers while keeping trust intact.

Primary Goals (v2)

- Become the default way Bangladeshi freelancers get paid from abroad
- Move family remittances onto a verified, recorded channel
- Reach EBITDA break-even by Q1 2028, as the model projects
- Launch at least one PRD v1 market in phase 3 without rebuilding the core

CrossPay_BD_36mo_Monthly_Projection.csv · EBITDA summed by quarter, Oct 2025–Sep 2028

The model needs about $1.63M of funding to cover losses before break-even; the bigger lever is gross margin, which is about 42% from month 13 on.

Key Metrics (KPIs)

KPI	Definition	Target	Source
Total users	Registered, KYC-passed	85,891 by Sep 2027; 396,860 by Sep 2028	Model
Monthly GMV	USD received per month	$14.8M by Sep 2027; $69.1M by Sep 2028	Model
Monthly revenue	Fees + FX + fixed	$1.08M by Sep 2028	Model

KPI	Definition	Target	Source
Activation rate	Signups who receive a first payment in 30 days	55% freelancers, 45% families	Model active rates
Monthly churn	Users lost per month	≤ 2.5% freelancers, ≤ 2% families	Model
CAC	Cost to acquire one user	≤ $3.00	Model
Payout time	Median minutes from request to wallet delivery	≤ 5 min to bKash/Nagad	Proposed
KYC pass rate	Approved on first attempt	≥ 85%	Proposed
Fraud loss	Losses as share of GMV	≤ 0.1% (the model's reserve)	Model
NPS	Quarterly survey	≥ 50	Proposed

PRD v1 aimed for 1M users in 24 months; the model reaches 85,891 at month 24. One of the two needs to change (section 11).

4. Product Scope

Phase 2 turns the prototype into a licensed, production product in Bangladesh; phase 3 adds new markets and earnings-based services.

Built in prototype v0.1 (baseline for v2)

- Multi-currency wallet (USD + local), hide-balance, rate card vs mid-market
- Payment request links with live fee breakdown and invoice preview
- Withdraw to bKash, Nagad or bank; convert with a 30-second rate lock
- Family tab with a CrossPay tag; activity with filters and status tracker
- Sign-up with KYC (ID scan + selfie), PIN creation, optional fingerprint
- Sign-in with SMS code + PIN; new-device selfie; step-up above $500; lockout and PIN recovery
- Light/dark mode; English and partial Bangla; five-country switcher

Future Scope

Feature	Description	Priority	Phase
Production KYC and AML	Live ID-verification partner, sanctions screening, transaction monitoring rules	High	Phase 2

Feature	Description	Priority	Phase
Platform payouts	Receive from freelance platforms through partner integrations	High	Phase 2
Invoices v2	Recurring invoices, reminders, partial payments, PDF export	High	Phase 2
Income statements	Monthly statements and proof of foreign income for banks and tax	High	Phase 2
Family sender channel	Relatives abroad send through partner remittance firms or a sender web app	High	Phase 2
Full Bangla and accessibility	Every screen in Bangla; screen-reader and large-text QA	High	Phase 2
EUR and GBP wallets	Receive and hold euro and pound balances	Medium	Phase 2
Rate alerts and scheduled conversion	Notify at a target rate; convert automatically	Medium	Phase 2
Referral rewards	Invite flow live, reward on the invitee's first payment	Medium	Phase 2
Risk-based authentication	Passkeys, device risk score, SIM-swap checks before sensitive actions	Medium	Phase 2
Multi-market launch	Nigeria and the Philippines first, then India and LATAM	High	Phase 3
Agency and team accounts	Several users with roles under one business wallet	Medium	Phase 3

Feature	Description	Priority	Phase
Virtual USD card	Pay for software and subscriptions from the USD wallet	Medium	Phase 3
Earnings-based advances	Small advances via a licensed lender, scored on transaction history	Low	Phase 3
USDT payout	Stablecoin payout in markets where it is legal; not Bangladesh	Low	Later

Out of Scope (v2)

- CrossPay's own lending book (advances only through a licensed partner)
- Crypto products in Bangladesh
- Cash-in/cash-out agent network
- Enterprise payroll and bulk disbursement

5. UX & Design Considerations

The prototype's "calm money" foundations carry into v2 unchanged; new work extends them to Bangla-first copy, sender flows and stronger security without adding friction to everyday payments.

Design foundations (from prototype v0.1)

- Colour: deep emerald #0B5D4B for trust and primary actions; marigold #F2B24C for people and success; burnt orange for errors so they read apart from green
- Mode: full light and dark themes; every text pair measured at WCAG AA (4.5:1) or better
- Tone: plain and reassuring — "Request payment", "0.7% margin, nothing hidden", "That PIN didn't match. 2 tries left."
- Trust cues: ID-verified badge, 3-step status tracker with ETA, fee breakdown before every confirm, rate-lock countdown, hide-balance

Access and authentication

Moment	What the user does	Why
Sign-up	SMS code, ID scan, selfie, create PIN, optional fingerprint	Proves identity once and binds the phone
Sign-in, trusted phone	SMS code + PIN	Two factors on every new session
Sign-in, new phone	SMS code + PIN + selfie; withdrawals capped for 24 hours	Stops SIM-swap takeovers

Moment	What the user does	Why
Payment of $500 or more	PIN + SMS code	Step-up for high-value moves
3 wrong PINs	Access paused; reset with SMS code + selfie + new PIN	Brute-force protection with a self-serve way back

The $500 threshold and 24-hour cap are prototype values; compliance confirms them in phase 2.

Localization

- Bangla is a first-class language: full coverage in phase 2, written by native copywriters, not machine-translated
- Bengali digits and lakh grouping for amounts when Bangla is selected
- v1 languages (Spanish, Hindi, Tagalog, Swahili) ship with their market in phase 3

Low bandwidth

- Core flows use inline vector icons and no images; two web fonts with system fallbacks
- Every money action must recover cleanly from a dropped connection (idempotent requests, clear "still processing" state)

Wireframes/Mockups: CrossPay App Prototype canvas (interactive prototype + design foundations board)

6. Technical Requirements

v2 runs on licensed partners in each market: CrossPay owns the app, ledger and risk engine, while partners hold funds and move money on local rails.

Platform(s): iOS, Android (Android first in Bangladesh), partner API for payout partners, internal ops console

Architecture / Dependencies

Layer	Bangladesh (phase 2)	Other markets (phase 3)	Status
Inbound collection	Licensed bank or payment partner for USD, EUR, GBP receipts	v1 rails: Flutterwave, Rapyd, Stripe Connect	BD partner to select
Local payout	bKash, Nagad, bank transfer through the partner	GCash, Maya, UPI, local bank rails	Integration agreements needed
Wallet and custody	Funds held by the licensed partner; CrossPay ledger mirrors balances	v1: MangoPay	Confirm per market

Layer	Bangladesh (phase 2)	Other markets (phase 3)	Status
KYC	ID-verification partner with Bangladesh NID support	v1: Jumio	Confirm BD document coverage
Compliance screening	Sanctions and PEP screening, transaction monitoring	v1: Alloy	Confirm BD coverage
Messaging	SMS gateway for codes; push notifications	Same	Choose local SMS route

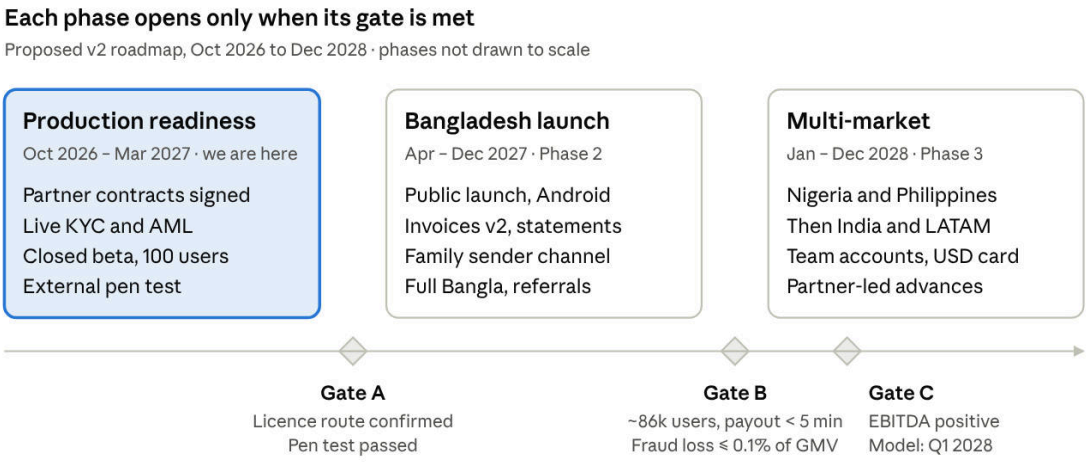

Whether each v1 partner supports Bangladesh is unverified; confirm with each partner before contracting.

Security Requirements

- Carry forward v1: PCI-DSS, GDPR, PSD2-aligned practices, encryption at rest and in transit, device binding, biometrics, fraud scoring
- Add: Bangladesh Bank requirements for inward remittance and data handling (to be confirmed with counsel)
- Multi-factor sign-in, step-up authentication and lockout as specified in section 5
- Rate-limit SMS codes; detect SIM swaps and emulators before sensitive actions
- Idempotent payment APIs and a double-entry ledger reconciled daily with each partner
- Audit log of every security event, visible to the user in notifications

7. Development & Testing

v2 ships in three gated phases: production readiness now, a Bangladesh launch in 2027, and multi-market expansion in 2028.

proposed roadmap · 3 phases, 3 gates

Dates are proposals; each phase starts only when the gate before it is met, so a slipped gate moves everything after it.

Approach: Agile, biweekly sprints with sprint reviews (as v1); a security review is part of every sprint that touches money or access.

Testing Strategy

- Unit + integration tests, plus contract tests against every partner sandbox
- UAT with 100 pilot users in Bangladesh (both segments) before Gate A
- A/B tests on onboarding: KYC step order, PIN creation copy, fingerprint opt-in
- External penetration test before launch and after any auth change
- Fraud red-team: SIM swap, account takeover, mule accounts, refund abuse
- Bangla copy review by native speakers; accessibility QA with screen readers

Release Plan

1. Closed beta in Dhaka with invited freelancers and families
2. Public Bangladesh launch, Android first, iOS within the same phase
3. Nigeria and the Philippines (the v1 beta markets), then India and LATAM
4. Feedback loop via in-app survey + CS dashboard (as v1)

8. Go-To-Market (GTM) Strategy

Win Bangladeshi freelancers first through community and platform channels at the model's $3 CAC, then reach families through the senders abroad.

Target Segments

- Freelancers on digital platforms (Upwork, Fiverr) and with direct overseas clients
- Families receiving remittances, reached through relatives working in the Gulf, UK and Malaysia
- Phase 3: the v1 segments — remote professionals in outsourcing firms and creators on YouTube or TikTok

Channels

Channel	Segment	Why it fits
Freelancer Facebook groups and training institutes	Freelancers	Where BD freelancers already ask how to get paid
Influencer and creator partnerships	Freelancers	Trust transfers from known peers
Gig platform partnerships	Freelancers	Payout option inside the platform

Channel	Segment	Why it fits
WhatsApp and IMO sharing of the CrossPay tag	Families	The sender abroad shares one tag with home
Remittance partners in sending countries	Families	Cash-in where migrant workers already send
Referral rewards	Both	Rewards only on the first real payment, which keeps CAC honest

Localization & Compliance

- Bangla-first marketing and in-app copy; English as second language
- Inward remittance only through licensed partners; marketing never implies CrossPay is a bank
- Register local entities or partner models per market before phase 3 launches (v1)

User Enablement

- Help center in Bangla and English with short videos on payment links, cash-out and security
- In-app onboarding coach for the first payment request
- Live chat support, with an escalation path for locked accounts and suspected fraud

9. Post-Launch & Analytics

Track the funnel and money-movement health weekly against the model; a metric two weeks off-plan triggers a review, not a wait for the quarter.

Monitoring Metrics

- Activation funnel: signup → KYC passed → PIN set → first payment received → first cash-out
- KYC pass rate and drop-off by step (ID scan, selfie, review)
- Median payout speed by rail (bKash, Nagad, bank)
- Daily and monthly active users, split by segment
- Security: lockouts, PIN resets, new-device sign-ins, step-up completion rate, blocked "This wasn't me" sign-ins
- Feature adoption: payment links, conversions, family tag shares, statements downloaded
- Unit economics vs model: revenue per active user, processing and payout cost, fraud reserve use

Iteration Plan

- Quarterly NPS and A/B tests on feature variants (as v1)
- Revisit the $500 step-up threshold once real fraud data exists: lower it if losses rise, raise it if completion drops
- v1's Phase 2 (USDT payout) and Phase 3 (lending) are kept, re-scoped as partner-led and market-specific (section 4)

Risks

Risk	Impact	Mitigation
No licensed BD partner on workable terms	Blocks launch	Run two partner tracks in parallel during phase 1.5
Account takeover via SIM swap	Customer losses, trust	New-device selfie, 24-hour cap, SIM-swap checks
Growth below model	Break-even slips past Q1 2028	Gate B review; shift spend to the cheaper segment
FX margin undercut by competitors	Revenue per user falls	Compete on speed and Bangla experience; test margin bands
Partner downtime on a payout rail	Late payouts, support load	Route to a second rail; show honest delay status

10. Stakeholders

Role	Owner	v2 responsibility
PM	You	Owns this PRD, gates and prioritisation
Engineering Lead	TBA	Partner integrations, ledger, auth and step-up
UX Designer	[Insert name]	Bangla-first flows, sender channel, security UX
Legal/Compliance	[Insert name]	Licence route, KYC/AML rules, step-up thresholds
Risk & Fraud	[Insert name]	Fraud scoring, SIM-swap controls, lockout policy
Data & Analytics	[Insert name]	Funnel and model-vs-actual dashboards
GTM/Marketing	[Insert name]	BD community channels, referrals, partner launches
Finance	[Insert name]	Funding plan for the ~$1.63M pre-break-even losses

11. Approvals & Status

v2 is a draft for review: scope is proposed, not locked, and five decisions below must close before Gate A.

Stakeholder	Role	Status	Notes
Product Owner	PM	In review	Future scope drafted from prototype v0.1 and the 36-month model
Engineering	Tech Lead	Not started	Estimate partner integrations and auth hardening
Legal	Compliance	Not started	Licence route; step-up and lockout policy
Finance	CFO	Not started	Funding for pre-break-even losses
Marketing	GTM	Not started	BD channel budget at $3 CAC

Open decisions

- User goal: keep v1's 1M users in 24 months, or adopt the model's 85,891 at month 24?
- Licence route in Bangladesh: which licensed bank or payment partner, and under which permission?
- Step-up threshold ($500) and new-device withdrawal cap (24 hours): confirm or change
- Exchange rates for NG, PH, IN and AR are placeholders in the prototype; replace with partner quotes
- Family sender channel: own sender app vs partner remittance firms

Version: v2.0 draft (builds on PRD v1.0, last updated 2025-08-18)
